Lesson 8: Evaluation the accelerations in kinematic mechanisms by graphical analysis

Suggested Teaching Time: 8 hours

Learning Outcome 1: Understand the kinematics of mechanisms

| Topic | Suggested Teaching | Suggested Resources |
|---|---|--|
| <p>Evaluate the accelerations in kinematic mechanisms by graphical analysis (A.C. 1.3)</p> | <p>Acceleration Diagrams This involves the construction of diagrams which need to be done accurately and to a suitable scale. Students should use: a Drawing board, ruler, compass, protractor, and triangles or a suitable CAD Package which the students are familiar with.</p> <p>Tutor-led learning. learner research and activity on the concepts of: Centripetal (radial) Acceleration, Tangential acceleration and Coriolis Acceleration.</p> <p>Tutor should demonstrate the drawing of the different types of drawings and then get the students to solve example questions using the graphical method, tutor to assist individual students, and correcting errors as required.</p> <p>Diagram types to include: Instantaneous centres; relative velocities; velocity and acceleration diagrams. For the following types of mechanisms: Four-bar linkage; crank and rocker; drag link; slider-crank; scotch yoke; quick-return.</p> | <p>Books Software Basic CAD programme Practical equipment Drawing board, ruler, compass, protractor, and triangles Examples of Resolute and Prismatic joints, kinematic chains, planar kinematic mechanisms, and spatial kinematic mechanisms These are to include working examples of the following:</p> <ul style="list-style-type: none"> • Four-bar linkage; • crank and rocker; • drag link; • slider-crank; • scotch yoke; • Quick-return <p>Website http://www.freestudy.co.uk/dynamics/velaccdiag.pdf</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

Lesson 9: Evaluation of the motions in kinematic mechanisms by mathematical analysis

Suggested Teaching Time: 8 hours

Learning Outcome 1: Understand the kinematics of mechanisms

| Topic | Suggested Teaching | Suggested Resources |
|--|---|--|
| <p>evaluate the motions in kinematic mechanisms by mathematical analysis (A.C. 1.4)</p> | <p>Whole-class teaching to cover the relationship between Displacement, Velocity and Acceleration</p> <ul style="list-style-type: none"> • Displacement (x) = $R(\sin \omega t)$ • Velocity (v) = $dx/dt = \omega R \cos(\omega t)$ • Acceleration (a) = $dv/dt = -\omega^2 R \sin(\omega t)$ <p>Tutor-led discussion on how we can use mathematics to solve the problems given in previous lesson rather than using diagrams.</p> <p>The tutor should work through typical examples of calculations covering the different equations and the learners should then work through other examples of such calculations. These examples should cover the following types of mechanisms: Four-bar linkage; crank and rocker; drag link; slider-crank; scotch yoke; quick-return.</p> <p>The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained.</p> | <p>Books Software Practical equipment</p> <p>Examples of Resolute and Prismatic joints Examples of kinematic chains Examples of planar kinematic mechanisms Examples of spatial kinematic mechanisms These to include working examples of the following:</p> <ul style="list-style-type: none"> • Four-bar linkage • Crank and rocker • Drag link • Slider-crank • Scotch yoke • Quick-return <p>Website http://www.freestudy.co.uk/dynamics/velaccdiag.pdf</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

Lesson 10: Gear Trains

Suggested Teaching Time: 4 hours

Learning Outcome 2: Understand the dynamics of machines

| Topic | Suggested Teaching | Suggested Resources |
|---|--|--|
| <p>Analyse the operation of a gear train in a machine (A.C. 2.1)</p> | <p>Tutor-led group teaching on the concept of gears, how and why they are used progressing from simple gear trains to compound gear trains and introducing the three types of epicyclic gearboxes.</p> <p>Tutor to discuss Basic gearbox theory, covering gear ratios, Torque and efficiency.</p> <p>Tutor-led discussion on how we can use mathematics to analyse the operation of a gear train in a machine.</p> <p>The tutor should work through typical examples of calculations covering the different equations and the learners should then work through other examples of such calculations. These examples should cover the following types of gearing: simple gear trains, compound gear trains and the three types of epicyclic gearboxes.</p> <p>The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained.</p> | <p>Books</p> <p>Software</p> <p>Practical equipment Practical boards and equipment demonstrating different layouts of gears with the option of changing gear ratios</p> <p>Website http://www.freestudy.co.uk/dynamics/gears.pdf http://ocw.uc3m.es/ingenieria-mecanica/machine-theory/lab-reports/analysis-of-gear-trains/at_download/file www.asee.org/public/conferences/1/papers/838/download</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

Lesson 11: The Forces in a machine

Suggested Teaching Time: 3 hours

Learning Outcome 2: Understand the dynamics of machines

| Topic | Suggested Teaching | Suggested Resources |
|---|--|---|
| <p>Analyse the forces in machines (A.C. 2.2)</p> | <p>Tutor-led discussion on how other forces affect the machines that we have been looking at so far, discussion to include: Gravitational; inertia; pressure; and frictional forces. Tutor to Adapt previous equations to include friction and the effect it has on a machine. Tutor to Adapt previous equations to include gravitational force and the effect it has on a machine. Tutor to Adapt previous equations to include inertia and the effect it has on a machine. Tutor to Adapt previous equations to include pressure and the effect it has on a machine.</p> <p>The tutor should work through typical examples of calculations covering the different equations and the learners should then work through other examples of such calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained.</p> | <p>Books Theory of machines and mechanisms by Dr.Jagadishlal, Metropolitan Book co. UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

| | |
|-----------------------------|---|
| Lesson 13: Flywheels | Suggested Teaching Time: 2 hours |
|-----------------------------|---|

Learning Outcome 2: Understand the dynamics of machines

| Topic | Suggested Teaching | Suggested Resources |
|---|--|---------------------|
| <p>Analyse the operation of a flywheel in a machine (A.C. 2.4)</p> | <p>Discuss the concept of a reciprocating machine and how it exerts erratic torque on to a shaft. Bring in concept of Kinetic energy and how it could be stored in a flywheel:</p> <ul style="list-style-type: none"> • $K.E. = I \omega^2/2$ <ul style="list-style-type: none"> • I is moment of inertia given by formula $I = Mk^2$ • ω is the angular velocity in rad/s • k is the radius of gyration in meters • M is the mass of the wheel • For a plain disk $I = MR^2/2$ where R is the outer radius • When a rotating body changes speed, the angular acceleration is related to the moment of inertia and the applied torque by the formula $T=I\alpha$. Where α is the angular acceleration in Rad/s^2 <p>Develop these concepts into the cyclic torque diagram for a machine and how we can then use these to carry out an energy analysis of a flywheel. The tutor should work through typical examples of calculations covering the different equations, and the learners should then work through other examples of such calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained.</p> | |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

Lesson 14: Balancing rotating masses

Suggested Teaching Time: 3 hours

Learning Outcome 3: Understand the need for machine balancing

| Topic | Suggested Teaching | Suggested Resources |
|--|---|---|
| <p>Analyse balancing of rotating masses in a machine (A.C. 3.1)</p> | <p>Tutor-led discussion on the concepts of balancing and why we need it. Explain the difference between Static balancing; and dynamic balancing:</p> <ul style="list-style-type: none"> • <i>Static Balance.</i> This occurs when there is no resultant centrifugal force and the centre of gravity is on the axis of rotation • <i>Dynamic Balance.</i> This occurs when there is no resulting turning moment along the axis. <p>Tutor-led instruction to cover a simple rotating disk. E.g. in machine where the centre of gravity is not the same as the centre of rotation there will be a single out of balance force and the force applied can be calculated using earlier calculations $C.F. = M \omega^2 r$ in order to balance this an equal and opposite force is needed such that $M_1 \omega^2 r_1 = M_2 \omega^2 r_2$ Develop this into a machine with several masses in one transverse plane, drawing Mr diagrams and solving the missing vector. The tutor should work through typical examples of calculations covering the different equations, and the learners should then work through other examples of such calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained. Students to be given the opportunity to carry out practical activities involving the balancing of a simple shaft and flywheel assembly.</p> | <p>Practical equipment Laboratory equipment to evaluate the effects of out-of-balance rotating masses in a simple shaft and flywheel assembly Website https://www.youtube.com/watch?v=l3jE-PXV-68</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

| Topic | Suggested Teaching | Suggested Resources |
|--|--|--|
| <p>Analyse balancing of rotating masses in a machine (A.C. 3.1)</p> | <p>Tutor-led discussion to consider machines that are not quite so simple and therefore have masses in different transverse planes. The centrifugal force produced is $F=Mr\omega^2$ The turning moment about the reference plane = T.M. = $Fx = Mr\omega^2x$ For dynamic and static balance we must work out the resultant turning moment and add masses at appropriate points to cancel it out. The appropriate points will be on two planes not coplanar with any of the original masses. This involves drawing two vector diagrams and since ω is common to all vectors we can again take $\omega=1$ and draw vectors representing Mr and Mrx. The tutor should work through typical examples of calculations covering the different equations, and the learners should then work through other examples of such calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained. Students to be given the opportunity to carry out practical activities involving the balancing of a simple shaft and flywheel assembly.</p> | <p>Practical equipment laboratory equipment to evaluate the effects of out-of-balance rotating masses in a simple machine having masses in different transverse planes</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

Lesson 15: Balancing reciprocating masses

Suggested Teaching Time: 3 hours

Learning Outcome 3: Understand the need for machine balancing

| Topic | Suggested Teaching | Suggested Resources |
|---|---|--|
| <p>analyse balancing of reciprocating masses in a machine (A.C. 3.2)</p> | <p>Group Discussion, recapping lessons learned about Slider-crank mechanisms discussing the general layout of piston con rod and crankshaft machine within the machine. Revisit the acceleration equation and work through a couple of examples as revision.</p> <p>Tutor to split the class into several groups and present them with the data for several reciprocating engines and get the groups to produce graphs showing displacement, velocity and acceleration against angle.</p> <p>Discuss results of graphs and how as n gets larger the nearer the results get to being harmonic</p> <p>Explain using the close approximation for acceleration how the inertia force required to accelerate can be given by</p> $F = M\omega r^2 R \left[\cos(\theta) + \frac{\cos(2\theta)}{n} \right]$ <p>and how this may be thought of as two separate forces.</p> <p>primary forces $F_P = M\omega^2 R \cos(\theta)$ secondary forces $F_S = M\omega r^2 R \left[\frac{\cos(2\theta)}{n} \right]$</p> <p>The tutor should work through typical examples of calculations covering a single reciprocating mass, and the learners should then work through other examples of such calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained.</p> | <p>Books Software Practical equipment Reciprocating machine with laboratory equipment for measuring vibration Website</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

| Topic | Suggested Teaching | Suggested Resources |
|---|---|---|
| <p>Analyse balancing of reciprocating masses in a machine (Continued) (A.C. 3.2)</p> | <p>Group discussion to develop this into a machine with several reciprocating masses in one transverse plane, and discussing complexity of arrangements. The tutor should work through typical examples of primary force calculations for multiple cylinder machines. They should then discuss the complexity of calculating the secondary forces in multiple piston machines and show the development of the formula for calculating the rotating masses.</p> $M\omega^2(R/n) \cos 2\theta = M_s(2\omega)^2 R_s \cos 2\theta = 4 M_s \omega^2 R \cos 2\theta$ <p>The tutor should work through typical examples of secondary force calculations for multiple cylinder machines. The learners should then work through examples of both primary and secondary force calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained. Tutor-led group learning to introduce different methods of balancing including the Lanchester balancer, reciprocating balance and contra rotating masses.</p> | <p>Practical equipment Reciprocating machine with laboratory equipment for measuring vibration Example of a Lanchester balancer Website http://www.fordscorpio.co.uk/tech2_3_2.htm</p> |

UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

| Lesson 16: Vibration | Suggested Teaching Time: 2 hours | |
|---|---|---|
| Learning Outcome 4: Understand the vibration of machines | | |
| Topic | Suggested Teaching | Suggested Resources |
| <p>Explain the causes of vibration in a simple machine system (A.C. 4.1)</p> | <p>Tutor-led discussion to cover what is meant by vibration and its causes. Discuss the following: Vibration can result from a number of conditions, acting alone or in combination. Problems may be caused by auxiliary equipment, not just the primary equipment. Imbalance (Imbalance could be caused by manufacturing defects (machining errors, casting flaws) or maintenance issues (deformed or dirty fan blades, missing balance weights)). Discuss the effect that machine speed has on the vibration and what effects vibration may have on the machine. Discuss Misalignment/shaft runout – Vibration can result when machine shafts are out of line. Angular misalignment occurs when the axes of (for example) a motor and pump are not parallel. When the axes are parallel but not exactly aligned, the condition is known as parallel misalignment. Misalignment may be caused during assembly or develop over time, due to thermal expansion, components shifting or improper reassembly after maintenance. The resulting vibration may be radial or axial (in line with the axis of the machine) or both. Discuss Wear – As components such as ball or roller bearings, drive belts or gears become worn, they may cause vibration. When a roller bearing race becomes pitted, for instance, the bearing rollers will cause a vibration each time they travel over the damaged area. A gear tooth that is heavily chipped or worn, or a drive belt that is breaking down, can also produce vibration. Discuss Looseness – Vibration that might otherwise go unnoticed may become obvious and destructive if the component that is vibrating has loose bearings or is loosely attached to its mounts. Such looseness may or may not be caused by the underlying vibration. Whatever its cause, looseness can allow any vibration present to cause damage, such as further bearing wear, wear and fatigue in equipment mounts and other components.</p> | <p>Website http://www.reliableplant.com/Read/24117/introduction-machinery-vibration http://www.proviso-systems.co.uk/images/stories/pdf/beginners_guide.pdf</p> |

| <p>Explain the causes of vibration in a simple machine system (Continued) (A.C. 4.1)</p> | <p>Tutor-led discussion on degrees of freedom recapping info learned in kinematic modelling lesson. Tutor to introduce the concept of free vibration and Forced vibration.</p> <p>Under the topic of free vibration the tutor should discuss a pendulum, an object bobbing in the water and a weight on a spring (Simple Harmonic Motion (SHM)); emphasising that it occurs naturally without energy being added to the vibrating system and dies away with time as the energy is dissipated.</p> <p>Whilst discussing these bring in Natural Frequency and the idea of dampening to reduce vibration.</p> <p>Tutor-led group learning, tutor to introduce the concept of forced vibration, develop discussion to cover the concepts of phase and resonance; where the phase relationship between the driving oscillation and the oscillation of the object being driven is different at different frequencies.</p> <p>Below resonance they are in phase with each other. At resonance the phase relationship is 90° or $\pi/2$ rad. Above resonance the phase relationship is 180° or π rad.</p> | <p>Books</p> <p>Mechanical Vibration Practice with Basic Theory Viswanatha Ramamurti Illustrated CRC Press, 2000 ISBN 0849309751, 9780849309755</p> <p>If applicable to local area/expertise Noise and Vibration from High-speed Trains Victor V. UNIT 518: THE DYNAMICS OF MACHINE SYSTEMS

Lesson 17: Vibration Analysis

Suggested Teaching Time: 3.5 hours

Learning Outcome 4: Understand the vibration of machines

| Topic | Suggested Teaching | Suggested Resources |
|--|---|--|
| <p>Analyse a system with one degree of freedom (A.C. 4.2)</p> | <p>Recap the following calculations</p> <p>Displacement (x) = $R(\sin \omega t)$ Velocity (v) = $dx/dt = \omega R \cos(\omega t)$ Acceleration (a) = $dv/dt = -\omega^2 R \sin(\omega t)$</p> <p>Tutor-led Instruction: Set up a pendulum and get students to discuss what will happen when you move the pendulum by applying a force and then remove the force. Show calculations for restoring torque and inertia torque and balance of moments. The tutor should work through typical examples of pendulum type calculations, the learners should then work through further examples of these calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained. Set up a Spring/mass system and get students to discuss what will happen when you raise and release the weight. The tutor should work through typical examples of spring mass system type calculations, the learners should then work through further examples of these calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained</p> <p>Set up a shaft/flywheel system and get students to discuss what will happen when you apply a force to the flywheel and release it. The tutor should work through typical examples of shaft/flywheel system type calculations, the learners should then work through further examples of these calculations. The tutor should provide feedback on the answers obtained and repeat the process until consistent answers are obtained.</p> | <p>Books Mechanical Vibration Practice with Basic Theory Viswanatha Ramamurti Illustrated CRC Press, 2000 ISBN 0849309751, 9780849309755</p> <p>Practical equipment Pendulum Stopwatch Spring/Mass system shaft/flywheel system;</p> <p>Website https://www.youtube.com/watch?v=dRkJuVh9hF0 https://www.youtube.com/watch?v=YbFgNsM6r44</p> |
